

Currency Significance

After the previous week's lowering, the Greenback's significance measure showed an upward trend. The composite was fluctuating in a range between 0.21 and 0.65, but its average gained only 0.01 points over the previous period's reading. Most of the USD/EUR components also showed a slight increase. The most notable rise was observed in the pair's bonds with the USD/AUD and USD/NZD, which gained 0.12 and 0.07 points, respectively. The average value of the component with USD/GBP, in turn, has lost 0.07 and 0.04 points compared with the short-term and long-term values.

Continuing the movement of the previous week, the US dollar's correlation composite started the week with a decline, and reduced to the minimum value of the period by Monday evening. On Tuesday, however, the aggregate showed a dynamic growth and reached the 0.55 level, gaining more than 0.25 points. On Wednesday and Thursday, the turbulence of the measure was caused by the US FOMC minutes, and the composite ranged from 0.49 to 0.55. Afterwards, the dollar's final post-FOMC drop pushed the measure up, and it reached the maximum value of the week. The aggregate held at this level till Friday noon, when it started to decline to eventually finish the period slightly below its weekly average.

Correlations (5 vs 20 days)

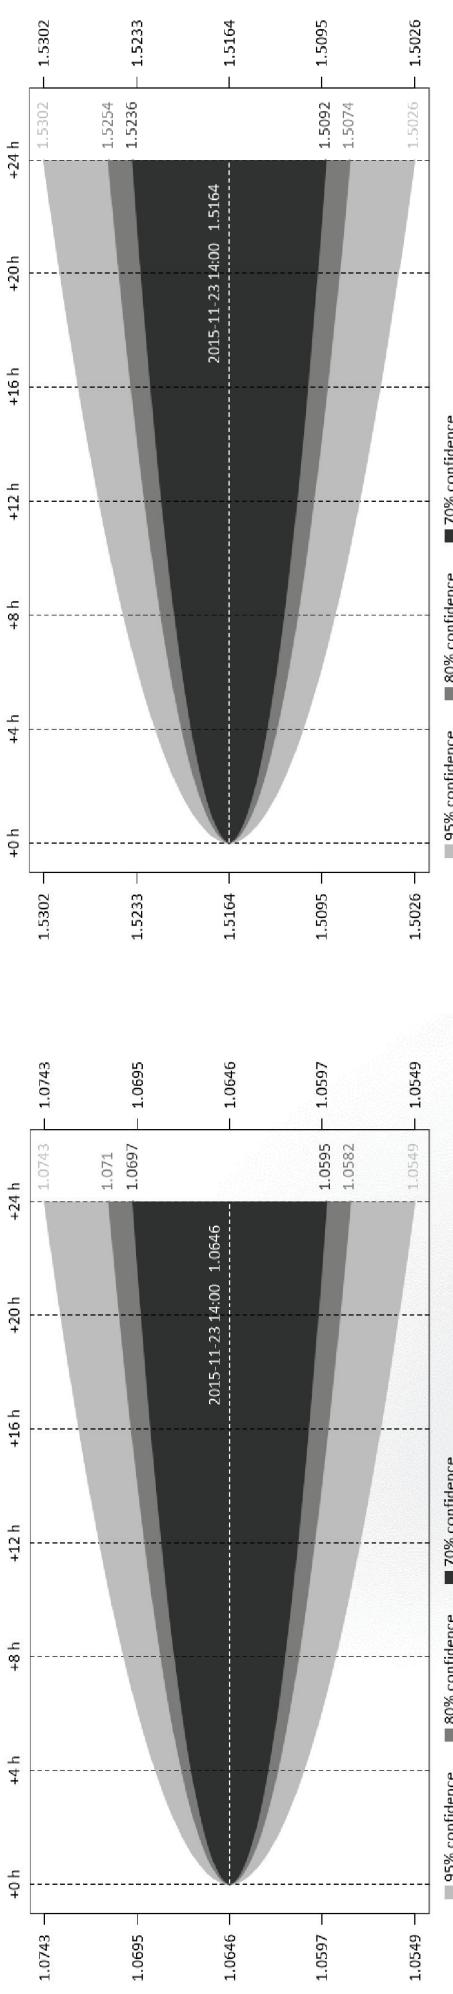

Mean Correlation Coefficient (with USDEUR)

Days	USD	USDEUR & USDJPY	USDEUR & USDCAD	USDEUR & USDKR	USDEUR & USDKR
